Now t 2k7Tl is small compared with 11 Log t when i is small. Also 11 Log t r (Log r)2 6 where t re; that is, when r is very small, 11 Log 11 differs from r Log r by a quantity infinitesimal compared with its value; moreover, this value can be made smaller than any finite quantity, on sufficiently diminishing r. From the foregoing equation, it therefore follows that v bt log t . . . , where the unexpressed parts are powers of t, of t log t, and of combinations of their powers; the term retained is the most important term, for ttOgty tm togtn log. In particular, if we choose the branch Log of the logarithmic function, we have v bt Log t. . . bt Log t V, where V can be made less than any assignable finite quantity on sufficiently diminishing t, and is at the same time infinitesimally small compared with 11 Log 11. 71. To establish the first theorem in 70, it would be possible to pass from the equation t where x (v, t) is a regular function of v and t, to the more extended theorem dealing with the general character of v in a finite region...
